

Another year and another cleaning season rapidly approaching!!

Can we start off with our usual plea, **PLEASE PLEASE** do get your bookings in now! We know it may seem a long way off but booking now avoids later disappointment and **early cleaning is one of the most effective methods of storage insect control.**

COMMUNICATION—to ensure we meet your cleaning requirements, can we remind you that keeping in close contact with the team as we work through stores and buildings is essential. **No one knows your layout better than you, discussing and showing the team the key problem areas will ensure nothing is missed.**

Our new team will be starting their training program and certification at the end of April ready for an **early May start**, to bring you safe and effective cleaning.

DEFRA updated its advice regarding safe animal feed storage. Highlighting the importance of regularly cleaning animal feed storage areas—silos, floors, bunkers and bins. Feed can become trapped in cracks and joints for many years becoming a source of moulds, toxins and contamination. Our system of dry air blasting is ideally suited to giving these problem areas a thorough clean. Cleaning certificates provided to record for compliance with audit requirements.

Fumigation

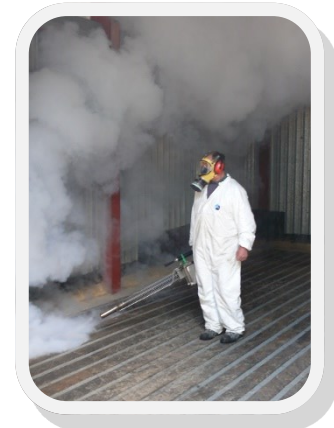

We can offer both Conventional and Organic Fumigation solutions

A vital second stage in the defense against store infestations is the application of an insecticide.

We can provide a full fumigation service for the building and stores. Our trained and licensed team apply a two stage process; first a high pressure spray applicator is used to apply an even spray of insecticide to all surfaces; this is followed up with a fogging to get into every inaccessible space. Full documentation is provided for assurance records
